### **CONTENTS**

- Introduction
- System Model
- Simulation Results

### Introduction

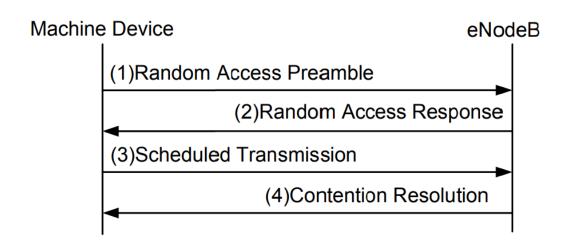

- According to the estimation of the wireless world research forum (WWRF), up to 7 trillion
   wireless devices will be connected to various networks for serving 7 billion people in the future.
- This extremely large number of devices may cause an addressing problem and may cause a shortage problem in limited radio resources.
- To support machine-to-machine (M2M) communications in future OFDMA-based cellular networks, several standardization bodies have studied M2M communications and specify features and requirements of M2M communications.

### Introduction

- They have low/no mobility, many devices, etc., which are quite different from those of human-to-human communications.
- Proposes a novel random-access scheme based on fixed timing alignment (TA) information at many fixed-location machine devices to reduce collision probability, lower average access delay, and achieve energy-efficiency.

### RANDOM ACCESS IN OFDMA-BASED SYSTEM

TABLE I
BACKOFF PARAMETER (BP) VALUES

Index	BP value	Index	BP value	Index	BP value
	(ms)		(ms)		(ms)
0	0	6	80	12	960
1	10	7	120	13	Reserved
2	20	8	160	14	Reserved
3	30	9	240	15	Reserved
4	40	10	320		
5	60	11	480		

Fig. 1. Random access procedure in LTE system

## Collision Probability

- Number of orthogonal preambles = M
- Assume we have k machine devices
- Probability (each device selects one preamble) =  $\frac{1}{M}$
- Probability that a given device selecting one preamble among M preambles experiences a collision with other device(s) among (k-1)  $device(s) = P_c^{ue}(M,k)$
- $P_c^{ue}(M, k) = 1 \left(1 \frac{1}{M}\right)^{k-1}$
- Collision probability increases as machine devices increase.

## Proposed Random Access Scheme

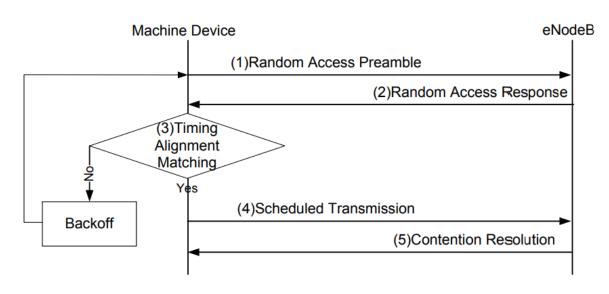

Fig. 2. Proposed random access procedure.

#### **ASSUMPTION:**

 TA value is fixed and unchanged. Due to measurement or estimation errors at eNodeB for every RA procedure, each fixed-location machine device needs a TA matching mechanism.

$$\begin{cases} matched, & if \ T_{curr} \in [T_{stored} - \varepsilon, T_{stored} + \varepsilon,] \\ mismatched, & otherwise \end{cases}$$

As the  $\varepsilon$  value becomes larger, more machine devices are likely to belong to the acceptable TA range. However, it may result in an increase in the collision probability.

## Collision Analysis, Access Delay, Energy Efficiency

- Suppose k+1 machine devices including one tagged device select their own preambles and attempt random accesses on a single RA slot.
- Assume tagged fixed-location machine o has a TA value of  $T_o = \frac{2r_o}{c}$
- $r_o \sim distance\ between\ tagged\ device\ and\ eNodeB$
- $c \sim light speed$
- Let f(r) be the pdf that there exists a fixed location machine device
- At distance (r, r + dr) from eNodeB.
- We want to calculate the probability that a tagged machine device experiences a collision with other machine device(s) among k devices.

## Collision Analysis, Access Delay, Energy Efficiency

• If tagged device is located according to the f(r) distribution, the collision probability of the tagged device is

$$P_c'^{ue} = \int_0^R f(r) \left( 1 - \left( 1 - \frac{P(r)}{M} \right)^k \right) dr$$

- where  $P(r) = \int_{r-\frac{\varepsilon c}{2}}^{r+\frac{\varepsilon c}{2}} f(r) dr$  is prob. that there exits one machine device
- which attempts random access on the same RA slot within a range of

$$-\left[r-\frac{\varepsilon c}{2}, r+\frac{\varepsilon c}{2}\right]$$

## Collision Analysis, Access Delay, Energy Efficiency

• In a uniformly distributed case of  $f(r) = \frac{2r}{R^2}$  the collision probability is

$$P_c'^{ue} = 1 - \frac{2}{R^2} \left\{ \int_{R - \frac{\varepsilon c}{2}}^{R} r \left( 1 - \frac{R^2 - \left( r - \frac{\varepsilon c}{2} \right)^2}{MR^2} \right)^k dr + \int_0^{\frac{\varepsilon c}{2}} r \left( 1 - \frac{\left( r + \frac{\varepsilon c}{2} \right)^2}{MR^2} \right)^k dr + \int_0^{\frac{\varepsilon c}{2}} r \left( 1 - \frac{\left( r + \frac{\varepsilon c}{2} \right)^2}{MR^2} \right)^k dr + \int_0^{\frac{\varepsilon c}{2}} r \left( 1 - \frac{\left( r + \frac{\varepsilon c}{2} \right)^2}{MR^2} \right)^k dr + \int_0^{\frac{\varepsilon c}{2}} r \left( 1 - \frac{\left( r + \frac{\varepsilon c}{2} \right)^2}{MR^2} \right)^k dr + \int_0^{\frac{\varepsilon c}{2}} r \left( 1 - \frac{\left( r + \frac{\varepsilon c}{2} \right)^2}{MR^2} \right)^k dr + \int_0^{\frac{\varepsilon c}{2}} r \left( 1 - \frac{\left( r + \frac{\varepsilon c}{2} \right)^2}{MR^2} \right)^k dr + \int_0^{\frac{\varepsilon c}{2}} r \left( 1 - \frac{\left( r + \frac{\varepsilon c}{2} \right)^2}{MR^2} \right)^k dr + \int_0^{\frac{\varepsilon c}{2}} r \left( 1 - \frac{\left( r + \frac{\varepsilon c}{2} \right)^2}{MR^2} \right)^k dr + \int_0^{\frac{\varepsilon c}{2}} r \left( 1 - \frac{\left( r + \frac{\varepsilon c}{2} \right)^2}{MR^2} \right)^k dr + \int_0^{\frac{\varepsilon c}{2}} r \left( 1 - \frac{\left( r + \frac{\varepsilon c}{2} \right)^2}{MR^2} \right)^k dr + \int_0^{\frac{\varepsilon c}{2}} r \left( 1 - \frac{\left( r + \frac{\varepsilon c}{2} \right)^2}{MR^2} \right)^k dr + \int_0^{\frac{\varepsilon c}{2}} r \left( 1 - \frac{\left( r + \frac{\varepsilon c}{2} \right)^2}{MR^2} \right)^k dr + \int_0^{\frac{\varepsilon c}{2}} r \left( 1 - \frac{\left( r + \frac{\varepsilon c}{2} \right)^2}{MR^2} \right)^k dr + \int_0^{\frac{\varepsilon c}{2}} r \left( 1 - \frac{\left( r + \frac{\varepsilon c}{2} \right)^2}{MR^2} \right)^k dr + \int_0^{\frac{\varepsilon c}{2}} r \left( 1 - \frac{\left( r + \frac{\varepsilon c}{2} \right)^2}{MR^2} \right)^k dr + \int_0^{\frac{\varepsilon c}{2}} r \left( 1 - \frac{\left( r + \frac{\varepsilon c}{2} \right)^2}{MR^2} \right)^k dr + \int_0^{\frac{\varepsilon c}{2}} r \left( 1 - \frac{\left( r + \frac{\varepsilon c}{2} \right)^2}{MR^2} \right)^k dr + \int_0^{\frac{\varepsilon c}{2}} r \left( 1 - \frac{\left( r + \frac{\varepsilon c}{2} \right)^2}{MR^2} \right)^k dr + \int_0^{\frac{\varepsilon c}{2}} r \left( 1 - \frac{\left( r + \frac{\varepsilon c}{2} \right)^2}{MR^2} \right)^k dr + \int_0^{\frac{\varepsilon c}{2}} r \left( 1 - \frac{\left( r + \frac{\varepsilon c}{2} \right)^2}{MR^2} \right)^k dr + \int_0^{\frac{\varepsilon c}{2}} r \left( 1 - \frac{\left( r + \frac{\varepsilon c}{2} \right)^2}{MR^2} \right)^k dr + \int_0^{\frac{\varepsilon c}{2}} r \left( 1 - \frac{\left( r + \frac{\varepsilon c}{2} \right)^2}{MR^2} \right)^k dr + \int_0^{\frac{\varepsilon c}{2}} r \left( 1 - \frac{\left( r + \frac{\varepsilon c}{2} \right)^2}{MR^2} \right)^k dr + \int_0^{\frac{\varepsilon c}{2}} r \left( 1 - \frac{\left( r + \frac{\varepsilon c}{2} \right)^2}{MR^2} \right)^k dr + \int_0^{\frac{\varepsilon c}{2}} r \left( 1 - \frac{\left( r + \frac{\varepsilon c}{2} \right)^2}{MR^2} \right)^k dr + \int_0^{\frac{\varepsilon c}{2}} r \left( 1 - \frac{\left( r + \frac{\varepsilon c}{2} \right)^2}{MR^2} \right)^k dr + \int_0^{\frac{\varepsilon c}{2}} r \left( 1 - \frac{\left( r + \frac{\varepsilon c}{2} \right)^2}{MR^2} \right)^k dr + \int_0^{\frac{\varepsilon c}{2}} r \left( 1 - \frac{\left( r + \frac{\varepsilon c}{2} \right)^2}{MR^2} \right)^k dr + \int_0^{\frac{\varepsilon c}{2}} r \left( 1 - \frac{\left( r + \frac{\varepsilon c}{2} \right)^2}{MR^2} \right)^k dr + \int_0^{\frac{\varepsilon c}{2}} r \left( \frac$$

$$\frac{\left(4r\frac{\varepsilon c}{2}\right)^2}{MR^2}\right)^k dr \left\{ \dots \dots (*) \right\}$$

### Numerical Results

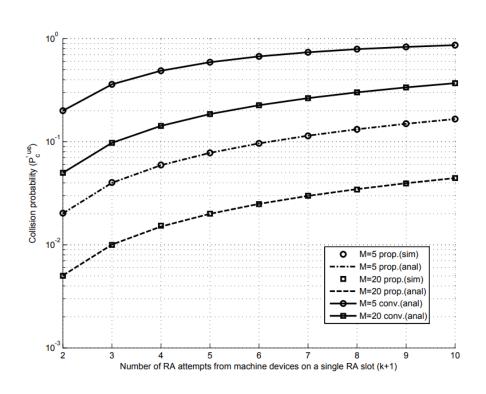

Fig. 4. Access Delay

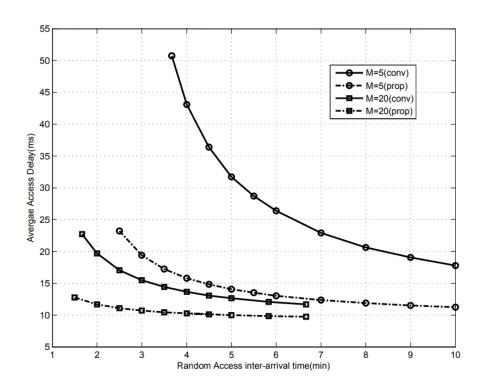

Fig. 5. Impact of the number of machine devices on the access delay of the proposed and conventional scheme.

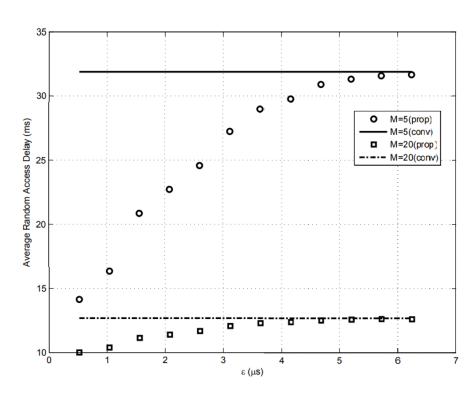

Fig. 6. Impact of  $\epsilon$  on the access delay of the proposed scheme.

### Conclusion

- In the proposed scheme, the collision probability is reduced due to the factor P(r). In other words, a tagged machine device experiences a collision when at least one of other machine devices located in  $(r-\frac{\varepsilon c}{2},\ r+\frac{\varepsilon c}{2})$  selects the same preamble as the tagged device on the same RA slot.
- In the conventional scheme, a tagged machine device may collide with any other machine devices selecting the same preamble on the same RA slot in the entire cell area.
